Warning: It appears that this host does not have an SPF record. There may be an SPF record on amazon.com: Check the [site report](#).

Setting up an SPF record helps prevent the delivery of forged emails from your domain. Please note that an SPF record will only protect the domain it is added to and not any [mail-enabled subdomains](#). It is recommended to add an SPF record to any subdomain with an MX record.

DMARC

DMARC (Domain-based Message Authentication, Reporting and Conformance) is a mechanism for domain owners to indicate how mail purporting to originate from their domain should be authenticated. It builds on SPF and DKIM, providing a method to set policy and to give reporting of failures. For more information please see [dmarc.org](#).

This host does not have a DMARC record. There may be a DMARC record on the site report for amazon.com: Check the [site report](#).

Web Trackers

Web Trackers are third-party resources loaded onto a webpage. Trackable resources include social sharing widgets, javascript files, and images. These trackers can be used to monitor individual user behaviour across the web. Data derived from these trackers are primarily used for advertising or analytics purposes.

- i) Steps to prevent SQL injection
- Validate user inputs :- A common first step to prevent SQL injection attacks is validating user inputs. First identify the essential SQL statements and establish for all valid SQL statement, leaving unvalidated statements out of the query.
 - Sanitize data by limiting special characters
Another component of safe guarding against SQL injection attacks is mitigating data sanitization. Because SQL injection attackers can use unique character sequence to take advantage of a database, sanitizing data not to allow string concatenation is critical.
 - Use prepared statements and parameterization
 - Use stored procedure in database :- Similar to parameterization using stored procedures also requires variable binding
 - Actively manage patches and updates
 - Raise virtual and physical firewalls
 - Harden your operating system and applications
 - Harden your operating system
 - Reduce your attack surface
 - Establish appropriate privileges and strict access

- j) Limit Read Access
- k) Encryption: keep your secret's secret
- l) Deny extended URLs
- m) No shared database or user accounts
- n) Enforce best practices for account and password policies
- o) Continuous monitoring SQL statements
- p) Code development & buying better software

3 files

html, php, txt

Step 1:

clone a facebook page and save as
facebook.html

Step 2:

download php script and save the file
as facebook.php

Step 3:

create a new text file (Empty) and
save as log.txt

Step 4:

we need to convert our system to
server by using tool called wamp

Step 5:

we need to change html code by replacing
original link with php file in action = place

Step 6:

rename facebook.html with index.html

Step 7:

go to c:\wamp\www folder delete everything
on folder and copy our 3 files
(html, php, txt)

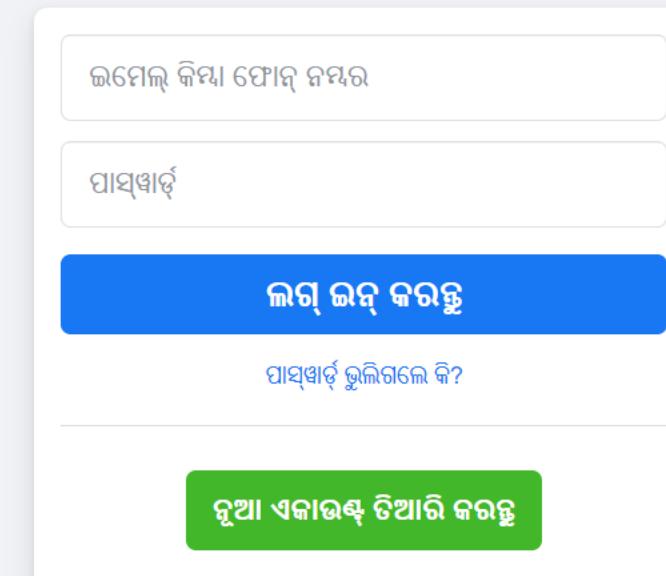

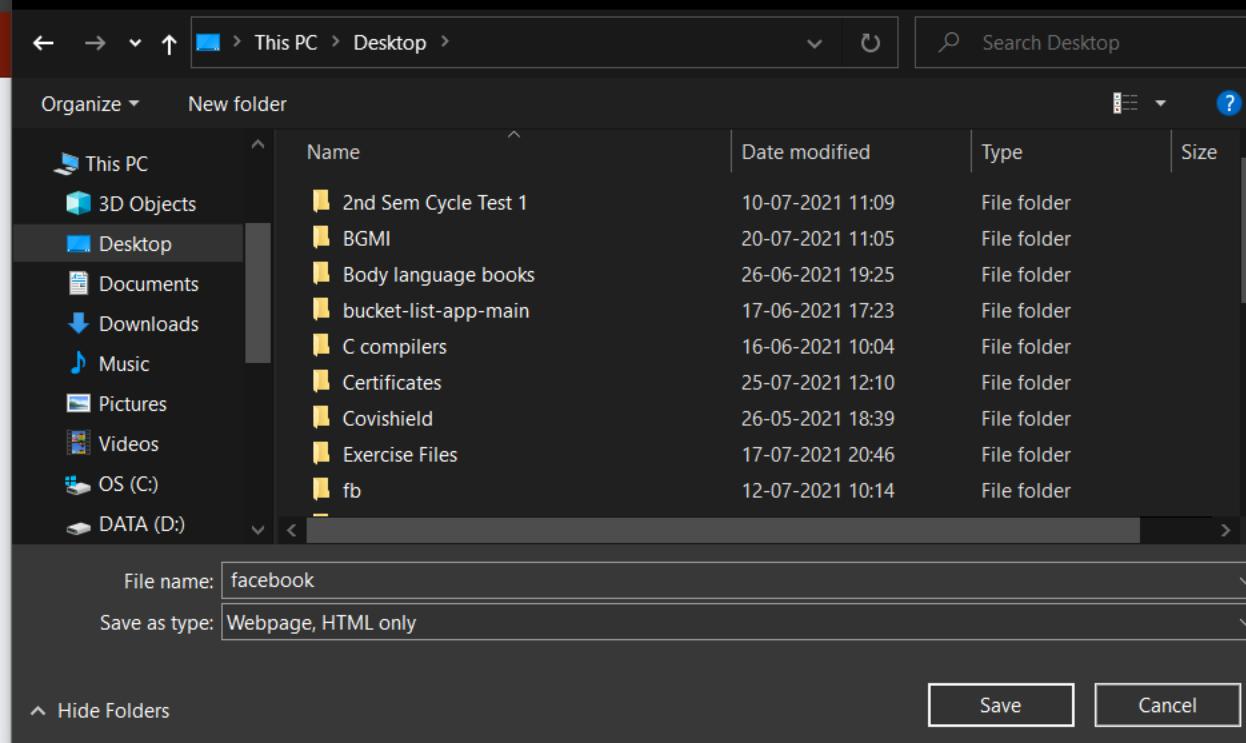

Steps:

check the ip address the ip address
in browser(127.0.0.1, 192.168.0.108, localhost)
it should show you facebook page

Prevention from Phishing

- unknowingly don't fill all the details in the link which is provided by the hacker
- Thoroughly see the mails because if a hacker sends you link through email there can be a huge number ^{of} grammar mistakes, Bad links, etc
- By chance if your mind strikes that your system got hacked. Then immediately move to the cyber police. They will definitely help you
- There is also another website which can detect fake website links. The name of the website is phishtank.com
